## Overview

---

The machine automatically aligns them using core or cladding alignment technology, then fuses them with an electric arc. For Mechanical Splicing: Align the fiber ends manually in a mechanical splice holder. Unlike using connectors, which are designed for frequent connection and disconnection at patch panels, splicing creates a permanent, stable joint with minimal light loss. Fiber optic splicing is the process of seamlessly joining two single Splicing has a lower optical loss and back-reflection than other terminations, making it the ideal choice for maintaining signal integrity and reliability in fiber optic networks.
