

Air supply outlets in the cold aisle of the computer room

Overview

Cold aisle containment systems use doors at aisle ends, ceiling panels or lids above racks, and structural frames to create enclosed zones where cold supply air flows directly to IT equipment intakes. (light g power panel) since this may influence the selection of the power equipment of data center. In this Guide to Airflow Management we look at what Airflow Management is, why it is important, and how it can be improved. When implemented correctly, they improve efficiency, reduce energy consumption, extend equipment life, and enhance overall reliability.

the coolest air temperatures in the data center are found in the cold aisle. Hot aisles are formed by the space between two rows of back to back racks where the hot exhaust air from both racks is directed

Guide To Airflow Management In Data Centres

The cold aisles are then supplied with cold air, in raised floor environments via grilles placed only in the cold aisle. Where the racks are positioned within the room is

Move to a Hot Aisle/Cold Aisle Layout

This will not work in a hot aisle/cold aisle configuration because the return air has been

concentrated in hot aisles and its temperature is therefore substantially higher.

FOCUSED COOLING USING COLD AISLE CONTAINMENT

Conventional Cooling The conventional cooling method circulates cold air from computer room precision air conditioning (CRAC) units via a plenum under a raised floor. The CRAC units are located outside
