

Ambient Temperature Requirements for Optical Modules

Overview

The most common optical modules are C-TEMP, and their normal operating temperature ranges from 0 to +70°C. Telcordia NEBSTM Requirements: Physical Protection GR-63 CORE outlines the temperature range for a touchable surface in normal use (short periods) as 55°C for a metal surface and 70°C for non-metals such as the pull handle of the module. Modern optical modules convert electrical data to optical data to overcome losses associated with electrical transmission. With each generation, they deliver higher data rates, such as 100 Gbps, 400 Gbps, and soon 800 Gbps. This guide delves into the distinctions between Commercial (COM), Extended (EXT), and Industrial (IND) temperature ranges, highlighting their applications and providing examples from LINK-PP's product lineup. Why Operating Temperature Matters Operating outside their specified temperature range. 5 W, adding notable thermal load—be careful with high port density in sealed cabinets. Fiber Optic Transceiver also was known as Fiber Optical Transceiver, Optical Module, Optics Module etc.
