

Assembly of electrical boxes

Overview

Box building assembly is the electromechanical assembly process that includes enclosure fabrication or sourcing, installation and connection of PCBAs, cable harnesses, power supplies, connectors, sensors, displays, and other components. Box build assemblies are complex, compact units that have to meet a wide range of dimensional and mechanical requirements. They often need to operate sealed with significant amounts of heat output internally, while they need to resist corrosion, wind, snow, rain, external EMI, etc. A well-executed electronics box build project will turn components and sub-assemblies into a fully integrated, market-ready system. At Cablelynx Ltd, we have excellent working relationships with suppliers from electrical distributors, suppliers of plastic parts and housings to panel builders and metal work suppliers, offering a combined expertise to assist in manufacturing and design advice. Therefore, selecting the best components for your electro-mechanical box build makes your decisions all the more important for your custom cable assembly and box build.
