

Can pigtail fibers withstand high temperatures and at what temperature

Overview

With polyimide coatings or high-temperature acrylates, some cables withstand 300°C long-term and tolerate spikes to 490°C. Optical fiber's ability to withstand extreme heat and cold directly impacts signal integrity, network reliability, and maintenance costs, especially in harsh environments like industrial facilities, outdoor installations, and data centers. Thanks to its know-how and expertise, SEDI-ATI Fibres Optiques can offer you optical fiber-based assemblies or solutions capable of withstanding extreme temperatures of up to +800 °C, or even 1,000 °C with sapphire fiber. The melting point of silica is around 1,700 °C, so a bare optical fiber could. These conditions can cause degradation of the optical fiber material, leading to increased signal loss and reduced reliability.
