

Can the pigtail be spliced

Overview

Unlike a patch cord—which has connectors on both ends—the bare fiber end of a pigtail is designed to be permanently spliced (either by fusion or mechanical splicing) to the incoming fiber cable in the field. A fiber pigtail is a short length of optical fiber that comes with a high-quality, factory-polished connector already installed on one end, leaving a length of exposed glass on the other. In this detailed video, we'll walk you through the fiber optic pigtail splicing process — from preparation to final testing. If you're new to fiber optics or want to enhance your technical skills, this guide will help you understand how to splice fiber pigtails safely and efficiently.
