

Data Center Vibration Isolation Cabinets

Overview

These cabinets feature reinforced steel structures and specialized connection elements to withstand shocks and vibrations, protecting servers, network devices, and other critical equipment during seismic events. Whether deployed on highways, rails, oceans, or in the air, equipment faces engine vibration, road shock, wave motion, turbulence, and emergency. There are over 450 data centres in the UK, with a significant number located near major urban environments such as London, Manchester, and Birmingham, due to the need for robust infrastructure and connectivity. The volume of data transferred daily is immense, so closer proximity of data centres. Solid sided construction, 2 pair of fully adjustable mounting rails, Seismic bolt down base with cable access holes, top panel with cable.
