

Development Process of Hollow-Core Optical Fiber

Overview

In this paper, we comprehensively review the progress in the development of HCFs including fiber design, fabrication and parameters (with comparisons to conventional single-mode fibers) and support technologies like splicing and testing. Furthermore, several HCF manufacturers have emerged: UK-based Microsoft Azure Fiber and two Microsoft subcontractors, namely Corning Inc. Recent advances in reducing optical losses and the prospects for telecommunication applications of hollow-core fibers, issues of transporting high-intensity optical radiation, and results on nonlinear compression and the generation of ultrashort pulses in gas-filled hollow-core fibers are reviewed. However, glass imposes a fundamental physical limitation because light travels through it approximately 30 percent slower than through air. Over-five octaves wide Raman combs in high-power picosecond-laser pumped H₂-filled inhibited coupling Kagome fiber. Hollow-core optical fibers (HCFs) have unique properties like low latency, negligible optical nonlinearity, wide low-loss spectrum, up to 2100 nm, the ability to carry high power, and potentially lower loss than solid-core single-mode fibers (SMFs).
