

# **Disadvantages of prefabricated relay protection modules**

## Overview

---

While prefabricated modules offer numerous advantages, they come with certain design limitations. Modular construction requires careful planning and coordination to align with factory production methods. The global energy transition is ushering in a new era of power electronic-dominated grids (PEDGs), to complement the increase in the widespread integration of renewable sources like wind and solar. High reliability: Due to the absence of mechanical components inside the relay module, it has a long service life and can withstand large load currents and high-frequency switching actions, thus possessing high reliability. Standardized, pre-assembled and integrated data center modules, also referred to in the data center industry as containerized or modular data centers, allow data center designers to shift Standardized, pre-assembled and integrated data center modules, also referred to in the data center industry as. They can also withstand harsh environments and operate without external power sources. The selection and applications of protective relays and their associated schemes shall achieve reliability, security, speed and properly coordinated.
