

Does a distribution box belong to a power distribution transformer

Overview

An electrical transformer box is a protective, enclosed unit containing a distribution transformer, which steps down high-voltage electricity to lower, usable voltages for homes and businesses. Substations, switching stations, power distribution substations, distribution rooms, and box-type transformers, as core nodes within this system, undertake the critical functions of "voltage boosting for transmission, voltage stepping-down for distribution, and safe control" of electrical energy. These boxes are commonly seen as green metal units on a concrete pad in neighborhoods with underground. Their primary function is to receive electrical power from a source (such as a transformer) and distribute it to various circuits.
