

Does the fiber optic cold connector have a light source

Overview

Thanks to their longer service life and limited changes in colour temperature in dim conditions, LEDs are increasingly becoming the preferred choice for fibre optic light guides. A fiber optic connector is a mechanical device used to align and join optical fibers, enabling light to pass through with minimal loss. Optical fiber is also harder to hack than copper, making it more secure and safer because it doesn't generate heat. Optical fiber transmission has the advantages of wide transmission frequency, large communication capacity, low loss, no electromagnetic interference, small diameter of optical cable, light weight, rich source of raw materials, etc. The so-called cold light source, is issued by the light emitted by the heat generated part of the infrared light filter effectively.
