

Drilling holes is required to install fiber optic cables

Overview

Directional drilling is a trenchless technology that allows contractors to install underground utilities—such as fiber optic cables—without digging large trenches. (FOA) was founded in 1995 to help develop the workforce to build the fiber optic networks to support a rapid expansion in communications and the Internet. It forms a critical backbone for modern communication networks across both urban and rural environments. When the trench has been set out, pilot holes needs to be dug at 25 - 30 m (80-100 feet) intervals, particularly at points where the new trench crosses existing services. It requires specialist equipment to plow a hole in the ground and simultaneously install the cable straight into the hole.
