

# **Fiber Optic Communication Signal Testing**

## Overview

---

Fiber testing is the process of verifying the performance of optical fiber cabling. These fibers are most commonly made of glass and are very thin, typically less than a tenth of the width of a human hair. Technicians use various tools to install, maintain, and troubleshoot fiber cabling: detection and verification testers, certification testers, inspection cameras, cleaning supplies, certification testers, and advanced optical time domain reflectometer (OTDR) instruments for troubleshooting and analysis of existing fiber optic cabling. Because fiber end faces are so small, contaminants that are too small to be seen can disrupt communications. While fiber optics inspection and cleaning fiber connectors is not new, it is growing in importance as links with increasingly higher data rates are driven.
