Functions of Wavelength Division Multiplexing Devices

Overview

Normal WDM (sometimes called BWDM) uses the two normal wavelengths 1310 and 1550 nm on one fiber. In fiber-optic communications, wavelength-division multiplexing (WDM) is a technology which multiplexes a number of optical carrier signals onto a single optical fiber by using different wavelengths (i. This makes it possible to scale capacity cost-effectively by using existing infrastructure more efficiently. Wavelength Division Multiplexing innovates by revolutionizing fiber optic communications by enabling the simultaneous transmission.
