

High Voltage Busbar Fault Standards

Overview

This technical article discusses criteria and requirements for designing protection systems for busbars in HV/EHV networks. Busbars have typically been left without dedicated protection, from the following reasons: It is a fact that the risk of a short circuit happening on modern metal clad equipment is insignificant, but it cannot be completely dismissed. It defines the minimum distances between live parts and between live parts and earthed metal parts. Busbar protection (BBP): Protection intended to detect and operate to clear faults on a busbar. High-impedance voltage differential protection is a solution to the challenge of CT saturation during external faults, as the high impedance of the relay forces the error current due to the saturated CT back through the CTs instead of the relay operating coil. BUSBAR PROTECTION

Busbar protection may simultaneously trip a number of bus segments or even an entire busbar of a substation and the fast elimination of busbar faults is critical to ensure that the transmission system

High Voltage Busbar Protection

Unit busbar protection meets these requirements. Also, in the case busbars sections are separated, only one section needs to be isolated to clear a fault. Busbar protection is actually the strongest when bus

High-Voltage Busbars

The busbar must function faultlessly throughout its service life. If a failure occurs, high repair costs are incurred in individual cases and in the event of a systemic fault, recall actions must be carried out.
