

How long is the lifespan of a dual-fiber optical module

Overview

In practice, most optical transceiver modules provide 3–7 years of reliable service, depending on conditions. With proper cooling, clean connections, and gentle handling, SFP+, QSFP+, QSFP28, QSFP-DD, and OSFP modules can deliver their full expected lifetime. Their lifespan depends on a mix of design, environment, and how they're used in real-world conditions. In well-cooled data centers, common modules such as SFP+ or QSFP28 often run reliably for 5–7 years. As a practical baseline, short-reach modules in clean, cooled data centers usually give you five to seven years of solid service; the most conservative shops plan for three to five years for edge racks, wiring closets, and any place where temperature and handling are outside ideal ranges. An Aging Test (or Life Test) is a longer-duration evaluation designed to simulate the effects of operational wear and tear over the transceiver's intended lifespan. This paper identifies the effects of temperature and humidity on the spectral attenuation of DC fibers and presents a reliability model capable of predicting lifetimes under prolonged exposure to typical temperature and humidity conditions experienced during storage and operation of fiber lasers.
