

How much loss does the pigtail lose when passing through the flange

Overview

If done properly, optical signals would pass through the link with low attenuation and little return loss. The estimate, called a "loss budget" is calculated using typical component losses for each part of the cable plant - the fiber, splices and/or connectors. Insertion loss is usually shortened to IL, and the unit of measurement for insertion loss is dBm. When the single-mode fiber pigtail is less than 50M and the multi-mode fiber pigtail is less than 10M, the loss of the pigtail itself can be ignored.
