

How to use the OTTR optical cable tester

Overview

Set the proper test parameters: Choose the correct wavelength and pulse width for the type of fibre you're testing (single-mode or multi-mode). OTDR (Optical Time Domain Reflectometer) is a commonly used test equipment in fiber optic communications, which can help detect the loss, fault points and other performance indicators of fiber optic lines. Page 1 This guide provides basic information to help you get started using the tester. For more detailed information, see the latest versions of the Versiv Users Manual and the Versiv Technical Reference Handbook provided on the Fluke Networks website. These pulses travel down the fibre and reflect when they encounter inconsistencies, like breaks, splices, or bends.
