

Large cache of core switches

Overview

Ordinary switches employ the out-port cache mode, but with technological advancements, network core layer switches have transitioned to a distributed cache architecture, enhancing device memory. Compared to regular switches, Layer 3 core switches have much bigger cache sizes. Using Huawei's next-generation VRP8 software platform, CE12800 series switches provide stable, reliable, secure, high-performance L2/L3. It is mainly responsible for high-speed forwarding and management of large amounts of data traffic from various aggregation layer switches. A core switch in networking serves as the high-capacity backbone, italic centralizing data flow and ensuring efficient communication between different network segments.
