## Overview

---

Multi-mode optical fiber is a type of mostly used for communication over short distances, such as within a building or on a campus. Multi-mode fiber has a fairly large core diameter that enables multiple light to be propagated and limits the maximum length of a transmission link because of. It's the dominant cabling choice inside buildings, data centers, and campus networks where distances stay under. This guide explains single mode and multimode optical fiber differences in structure, distance, cost, transfer speed, types of connectors, and of widely used network standards, so that you can have a better knowledge and confidently make a decision on which Fiber fits your application requirements.

Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can be used for data rates up to 800 Gbit/s. Multi-mode fiber has a fairly large core diameter that enables multiple light modes to be propagated and limits the maximum length of a transmission link because of modal dispersion. The standard G.651.1 defines the mos
