

The Relationship Between UK Energy and the Internet

Overview

Digital technologies such as Artificial Intelligence (AI), the Internet-of-Things (IoT) and Distributed Ledger Technology (DLT) can improve the efficiency and flexibility of the UK energy system, support deeper penetration of renewable and distributed energy sources, and. This report examines how the growth of digital services, and the data centres that support them, affects energy consumption in the UK. Much of the relationship between the United Kingdom (UK) and the European Union (EU) is set out in the Trade and Cooperation Agreement (TCA), which came fully into force in May 2021. Focusing on a case study of the United Kingdom, this paper explores the links between energy system digitalisation, digital exclusion, and energy poverty, with the wider aim of sketching out a research agenda for understanding the risks, opportunities, and inequalities latent within the transition. The energy sector is extensive; it involves many parties, supports many functions and comprises complex dynamics between commercial, policy and technical landscapes.

The Relationship Between UK Energy and the Internet

EU-UK relations on energy and climate

In the context of Russia's full-scale invasion of Ukraine, the UK and the EU have increased their coordination, particularly on energy. At the same time, both the EU and UK are moving ahead on

Digitalisation, energy and data demand: The impact of Internet traffic

This paper focuses on the phenomenal growth in Internet traffic, as a trend with important implications for energy demand. It outlines an agenda to better understand how data demand is

Iran war latest: UAE condemns sinking of Indian-flagged vessel off

Discussions between the two focused on bilateral relations, regional developments and co-ordination within multilateral frameworks, said state media. The Brics summit this year has been

YouGov UK: Data Analytics & Market Research Services
