

# **The wireless AP can be controlled by connecting to the switch s AC**

## Overview

---

The AC manages and controls APs in a centralized manner through Control and Provisioning of Wireless Access Points (CAPWAP) tunnels. CAPWAP tunnels provide the following functions: Maintain the running status of APs and the AC. Access points and wireless LAN cards connect devices in a network using radio signals. Network Switch: A switch is a physical device used to connect multiple devices on a local area network (LAN), facilitating communication by forwarding data packets to each MAC address of connected devices in an efficient manner. In centralized architecture, Fit APs need to go online before being managed and controlled by an AC.

## **Cisco Lightweight Access Point and WLC Pairing**

---

An AP can be primed with three controllers, primary, secondary, and tertiary WLCs, stored in nonvolatile memory so the AP can remember them even after a reboot.

## **UniFi Outdoor WiFi Access Points**

---

Deploy WiFi, anywhere. Incredibly versatile access points for extending WiFi over campuses, indoors and outside. Mesh-ready with long-range antenna integration.

## Support

---

Managing APs About AP management Managing a large number of APs is both time consuming and costly. The fit AP+AC network architecture enables an AC to implement centralized AP management

## How To Add an Access Point to a Wireless Router

---

We show you how to improve your wireless network's coverage by adding an access point to work in harmony with your main wireless router.

Create the AP manually to establish a connection between the AP and AC. In the device's web management interface, select Wireless AC from the navigation bar to access the wireless AC

## AP Online Process

---

An AP can go online in IPv4 or IPv6 mode, and the IPv4 mode takes precedence. CAPWAP tunnels support IPv4/IPv6 dual-stack, allowing an AC to manage APs in IPv4 and IPv6 modes. IPv4 and

## What Is Access Point Controller and How to Use?

---

**Conclusion** In summary, the access point controller (AC) serves as the linchpin in wireless networking, orchestrating access points (APs) for

## Cisco Lightweight Access Point and WLC Pairing

---

A Cisco Lightweight Access Point must be paired with a Wireless LAN Controller (WLC). Lightweight APs can be connected to the wired network without any

## Cisco Wireless Controller Configuration Guide, Release 8.5

---

This configuration can be done in the wireless network on a global as well as per-AP level. The LED state configuration at the global level takes precedence over the AP level.
