

Usage Environment for Fiber Optic OM3 and OM4

Overview

This guide explains the five generations of multimode fiber - OM1, OM2, OM3, OM4, and OM5 - covering their physical characteristics, color coding, bandwidth, maximum distances at different data rates, optical sources (LED, VCSEL, SWDM), and real-world applications in. To recap Optical Fiber can be divided into Multimode Fiber (MMF) and Single-Mode optical fiber (SMF). Multimode Fiber (MMF) has a core diameter, typically 50-100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at. However, despite their similar core size and compatibility, these two fiber standards differ in modal bandwidth, maximum. If you're buying multimode fiber optic cable, you've probably seen two grades mentioned everywhere: OM3 and OM4. Both look identical from the outside — aqua jacket, same connectors, same physical dimensions.
