

Using an optical power meter to check power loss

Overview

Insertion loss testing checks how much signal is lost as light travels through the fiber link. The IEC 61300-3-4 standard recommends the one-cord reference method for best accuracy. Fiber optic loss testing is an essential part of maintaining reliable, high-performance fiber optic networks because it helps identify potential issues and ensures that the system meets the required performance specifications. To use a power meter for fiber optic testing, always clean connectors first with lint-free wipes or click-to-clean tools. Other general purpose light power measuring devices are usually called radiometers, photometers, laser power.
