

What fiber optic communication networks exist in Iran

Overview

In 1993 Iran became the second country in the world to be connected to the Internet, and since then the government has made significant efforts to improve the nation's ICT infrastructure. Iran's national Internet connectivity infrastructure is based on two major networks: the public switched telephone network (PSTN) and the public data network. The PSTN provides a connection for end-users to Iran and has an extensive network of fiber-optic cables connecting its major cities and towns, as well as international cables connecting Europe to the Middle East and Asia. Iranian authorities have announced a significant increase in fiber optic infrastructure, reporting the deployment of 224 kilometers of fiber optic cable throughout Markazi Province in the past year. This expansion, highlighted by the regional head of the state telecommunications company, represents a significant milestone. SINET is a specialized internet service provider that offers high-speed, dedicated broadband solutions, utilizing advanced technologies like optical fiber connections. The Islamic Republic of Iran Broadcasting (IRIB), the state-run TV broadcaster, operates more than 60 television channels, more than 50 radio stations, and dozens of newspapers and websites; about 20 foreign Persian-language TV channels. Over 95% of the villages around the country are also getting access to high speed internet.
