

What is an optical module MCU

Overview

The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals. In optical transceiver modules—such as those in the LINK-PP SFP and QSFP family—Microcontroller Units (MCUs) act as the smart core, orchestrating essential monitoring, control, and diagnostics. By ensuring stable operation, MCUs uphold performance and longevity in demanding networks. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module.
