

What is the maximum number of ports on an aggregation switch

Overview

Out of the 12 ports, eight ports will be in the band I state and the remaining four will be in the backup state. For maximum throughput in gateway-to-aggregation switch connections, it is recommended to use SFP+. What is the difference between static LAG configurations and LACP?

Static LAG (Link Aggregation Group) Configurations: These require manual configuration on both ends of the link, which can be prone. A Link Aggregation Group (LAG) optimizes the usage of switch ports by linking a group of ports to form a single, logical, higher-bandwidth link. An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers.
