

What is the output power of the optical module in the computer room

Overview

Output optical power refers to the output optical power of the light source at the transmit end of the optical module. If the optical power is excessively low, the receiver cannot receive optical signals. A projection optical module consists of five main hardware components: A micro-electro-mechanical system (MEMS) device with up to millions of micromirrors that rapidly switch to create projected pixels of different color and intensity when modulated in sync with color sequential illumination.
