

# **What materials are used for optical module PCBs**

## Overview

---

Material Selection: Standard FR4 is rarely sufficient; high-speed materials like Megtron 6/7 or Rogers are required for 100G, 400G, and 800G applications. Optical modules are critical components in modern communication systems, acting as the bridge between electrical and optical signals. In simple terms, they convert electrical signals from devices like routers, switches, and servers into light signals that travel through fiber optic cables. Critical Metrics: Signal integrity (insertion loss, return loss) and thermal management are the two. An optical PCB is built for systems where the circuit board interacts with light—not just electricity.
