

What optical module is used for multimode fiber

Overview

These modules often use LEDs or VCSELs and operate at shorter wavelengths (typically 850nm). While single-mode fiber (SMF) dominates long-distance and carrier-grade infrastructure, multimode fiber remains the most cost-efficient and practical choice for enterprise buildings. Each module type uses LC interfaces, and professionals commonly group them together under the name LC SFP modules. Multimode optical fiber is the preferred choice for optical fiber communication systems due to its affordability and suitability for short-distance transmission. Understanding the differences between single-mode, multimode, and specialty optical fibers, along with their manufacturing constraints and emerging applications, is essential for engineers, researchers, and system designers working across the photonics ecosystem.
