

# **Where are the electrical distribution boxes in low-rise buildings**

## Overview

---

High and low voltage distribution rooms are typically located on the first basement level, with power distributed to each floor via electrical risers. The lightning protection level is classified as Grade 1, and the grounding protection system employs the TN-S configuration. The criteria for a high-quality electric supply include a consistent voltage level, limited voltage fluctuations within acceptable limits, a stable frequency, the absence of detrimental harmonics, protection against power surges and lightning, among other factors. In the United States, power companies provide electricity to medium or large buildings at 13,800 volts (13.4kV), power is distributed to a main distribution panel (primary distribution box).
