

Which is better twisted-pair cable or fiber optic communication

Overview

Optical fiber offers higher bandwidth and longer transmission distances with minimal signal loss compared to twisted pair cable, which is more susceptible to electromagnetic interference and limited in speed. Cables physically connect these devices, enabling them to communicate within a network. In computer networking, it is very important to know the distinctions between the different. As network applications accelerate toward hyper-connectivity in 2026—driven by Wi-Fi 7, multi-gigabit broadband, 10GBASE-T, fiber-deep networks, and 400G/800G data centers, understanding the differences between fiber optic cable, twisted pair cable, and coaxial cable has never been more essential. Twisted pair and fiber optic cables have been around for a while and are used primarily in network infrastructure around the world.
